ComRes interviewed 501 UK ‘affluent millennials’, defined as:

• Individuals born between 1981 and 1996
• Individuals who have investable assets of £25,000 or more.

Investable assets were defined as anything of financial value that could easily be used to invest, including cash, bank account balances, money in retirement accounts, mutual funds, stocks, bonds or anything similar but not including properties, vehicles, art jewellery or collectables.

Please note that due to rounding results may not always add up to a 100%.

Where a NET is shown, this refers to when responses from multiple answer options have been combined to produce an overall figure.

Social grades referred to in the report

The most recent occupation of the highest earning parent is used as an indicator of their ‘social grade’, categorised as follows:

Seg A: Higher managerial, administrative or professional roles
Seg B: Intermediate managerial, administrative or professional
Seg C: Supervisory, clerical and junior managerial, administrative or professional; skilled manual workers
Seg D: Semi and unskilled manual workers
Seg E: Casual or lowest trade workers; unemployed with state benefits only

As a leading UK law firm, Michelmores works with individuals and international families, entrepreneurs, family and privately owned businesses and large corporates across a variety of sectors in the UK and internationally.

We also act for private banks, financial institutions and wealth managers to ensure that they are well-equipped to advise their clients.

There are perceptions held of each generation, and the millennial generation is no different. Their lifestyles and outlooks, their social and financial intentions and their attitudes to the modern world are often represented stereotypically in press, media and common culture.

In association with research consultancy ComRes, we have interviewed affluent millennials about their approach to their money. We asked participants a range of questions to establish their attitudes and approaches to their money, investing, work, lifestyle and future intentions.

Our research reveals trends that counter the age group’s representation, challenging a number of commonly held myths around attitudes towards technology, investing, ethical imperatives and more.

At Michelmores, increasing our understanding of the millennial generation beyond the stereotypes, is key to enable us to recognise our current and future clients’ priorities and to offer them seamless legal support, on their personal and business ventures alike.

I hope you find the insights from the research interesting. If you would like to discuss any of the findings, please do get in touch.

Affluent millennials tend to have saved their way to affluence

Perhaps contrary to the expectation that affluent millennials’ investable assets are most likely to come from inherited wealth, or even through an innovative business venture, these findings indicate that many of those surveyed have most commonly saved their way to affluence.

70% say they generated these assets through their salary as an employee of a business they did not create. This is compared to two in five (40%) who say returns on investment products contributed these, and a third (34%) who say they received or inherited money.

This picture differs somewhat when comparing levels of affluence within this group.

For example, those with the highest amount of investable assets (£75,000 worth or more) are more likely than those with lower amounts (£25,000-74,999) to have gathered these through receiving or inheriting money (46% vs. 29% respectively). They are also considerably more likely to have profited from returns on investment products (56% vs. 34%) or from creating a business, product or service (36% vs. 15%).

Q4. And which of the following, if any, best describes where your 'investable assets' have come from?

Base: All respondents (n=501)

<table>
<thead>
<tr>
<th>Sources of investable assets</th>
<th>%</th>
</tr>
</thead>
<tbody>
<tr>
<td>Through my salary or wages as an employee of a business that I did not create</td>
<td>70%</td>
</tr>
<tr>
<td>Through returns on investment products</td>
<td>40%</td>
</tr>
<tr>
<td>Inherited money from a friend, family member or acquaintance</td>
<td>34%</td>
</tr>
<tr>
<td>Created a business, product or service</td>
<td>21%</td>
</tr>
<tr>
<td>By chance</td>
<td>18%</td>
</tr>
<tr>
<td>Other</td>
<td>1%</td>
</tr>
</tbody>
</table>
Q14a. We are really interested in your own personal story of about where your investable assets came from. In your own words, how would you describe how you made your 'investable assets'?

Base: All respondents (n=501 responses)

- “I created my own blog which is slowly growing to become a small business.”

- “I won a nice amount on the National Lottery.”

- “All my investable assets came from my own salary... nobody gave me a single penny.”

- “I worked hard through my monthly salary and I also invested in cryptocurrency.”

- “Buying stocks and shares via e-Toro and via banking options.”

- “I was privileged to make my investable assets through some inheritance from my family, and through the savings I have made from work and other investments.”

- “I have made them by working since I was 16 and regularly saving money. I've put this into ISAs and saving accounts ever since I began working.”

- “I've worked hard since 18 and saved 20% of every pay cheque since which I have invested.”

- “My dad’s career was in banking and accounting and so he’s got a good mentality towards this. He set up accounts for me and purchased stocks and shares in my name.”

- “I created my own blog which is slowly growing to become a small business.”
A desire for flexibility and risk-aversion is driving millennials’ investment decision-making

Flexibility is a key consideration for affluent millennials when they are making their investment decisions.

Close to half (46%) say that the ease of withdrawing or liquidating investments is an important factor when considering how to invest their money in a venture. Overall, seven in ten (72%) selected factors relating to ease or simplicity.

Additionally, many affluent millennials are also sensitive to the level of risk (44%), and this ranks among the factors most likely to be considered important. Around nine in ten (87%) think that at least one factor relating to profit is important.

Only a quarter (25%) say that whether the venture is new or innovative is important to them.

Q10. Which of the following, if any, are / would be important to you when considering how to invest your money in a venture?

Base: All respondents (n=501)

- Fund management fees: 46%
- How easily investments can be withdrawn or liquidated: 46%
- The level of risk: 44%
- The overall return/profit I will make: 44%
- Tax implications: 44%
- Whether I personally believe in the venture: 43%
- Whether I have been advised to invest in the venture: 37%
- How long it will take to make a profit on the investment: 36%
- Whether the venture is new or innovative: 25%
- The mix of investments in my portfolio: 21%
- Whether or not the process of investing is straight-forward: 35%
- Whether investments are easily customisable or I can manage them myself: 32%
- Whether the venture will have a positive social or environmental impact: 30%
- Whether my family members have invested money in a similar venture: 28%
- Whether my friends or peers have invested money in a similar venture: 26%
- Whether or not the process of investing is straightforward: 35%
- Whether my family members have invested money in a similar venture: 33%
- Whether my friends or peers have invested money in a similar venture: 25%
- Whether the venture is new or innovative: 21%
- The mix of investments in my portfolio: 19%
- Don’t know: 5%
- Other: 0%

www.michelmores.com
Similarly, at least a quarter say that they have invested in life insurance (30%), investment trusts (25%) or fixed income securities (23%).

Despite the widespread perception that affluent millennials have a preference for impact investments, millennial incidence of actually investing in sustainable or social investment funds is relatively low, with only 16% reporting that they have done so. This is perhaps the result of a risk-averse investment attitude amongst this audience, and the perception of these investments as volatile.

Remarkably one in five (20%) say that they have invested in cryptocurrency. Meanwhile, one in ten (11%) have engaged in peer-to-peer lending.

**Stocks, shares, pensions and annuities are the most popular financial products among affluent millennials - yet investment in cryptocurrency is higher than expected**

Traditional forms of investment continue to be popular with affluent millennials, who most commonly invest in shares (37%), pensions or annuities (37%), or stocks (35%).

Similarly, at least a quarter say that they have invested in life insurance (30%), investment trusts (25%) or fixed income securities (23%).

Despite the widespread perception that affluent millennials have a preference for impact investments, millennial incidence of actually investing in sustainable or social investment funds is relatively low, with only 16% reporting that they have done so. This is perhaps the result of a risk-averse investment attitude amongst this audience, and the perception of these investments as volatile.

Remarkably one in five (20%) say that they have invested in cryptocurrency. Meanwhile, one in ten (11%) have engaged in peer-to-peer lending.

“The survey result that 20% of those interviewed have invested in cryptocurrencies contrasts with a recent survey by the FCA which suggested a figure of 3% across the general population. This suggests a willingness amongst millennials to move away from traditional forms of investment and to embrace new technologies, almost regardless of the risks – perhaps part of a new identity for a new generation.”

Andrew Oldland QC, Senior Partner, Michelmore
When considering impact investments, there is a disconnect between millennials’ social values and their investment behaviour

Affluent millennials appear to be conflicted over the value of impact investments, with a considerable gap between their positive perceptions of them, and their actual levels of investment.

Although a clear majority agree that they feel a responsibility to use their money to have a positive impact on the world (73%), only 16% say that they have actually invested in sustainable or social impact funds.

This disconnect between perceptions and behaviour is underlined by the fact that three in five (62%) say that impact investments are less profitable than other types of investment, while 14% say they don’t know how impact investments perform in this respect.

Levels of affluence impact millennial attitudes towards impact investments. For example, those who have acquired £75,000 or more investable assets are considerably more likely than those with fewer assets to agree that they feel a responsibility to use their money to have a positive impact on the world (82% vs. 69% £25,000-74,999), with around two in five (43%) strongly agreeing with this.

“Whilst affluent millennials have positive views of impact investments, it is interesting to see that this is not yet reflected in their investment behaviour. Numerous studies show that returns from impact investments are comparable to conventional investments, yet confidence to invest in a sustainable way is relatively low. We do though expect this to change in the near future as impact investing becomes more mainstream and data evidencing its positive financial return is more accessible.”

Harry Trick, Senior Associate in the Impact Investing team
Perceptions of impact ventures as risky or volatile are the most common reasons for not investing... “...they do not make that much profit.”

“...I consider them fast to fluctuate and rise up and down, I have very little trust in them.”

“...I don’t know much about any social impact investment and also as far as I know, the benefits of them are lower.”

...and many also say that they don’t know enough about these investments, or are currently researching them...

“...I’m unaware of what they are, and worried about level of risk involved.”

“...I’m unfamiliar, I know a little bit but have a lack of knowledge about how this works, the risk, return and impact.”

“...I am in the process [of investing] as we speak and will in the next couple of months. I am in the research stage.”

...however, for some, personal experiences and circumstance mean that they are unlikely to invest in the near future.

“...I had a bad experience.”

“...I have my own saving goals at the moment and they’re not in my life plan.”

“...I haven’t had the opportunity to invest in them yet... however it is something that I plan to do once I have the money available.”

Q14a. You mentioned that you do not have social impact investments, but that it is important to you when you are considering investing money into a venture / but that it is more important to you than making the highest possible return / but that it is more important to you when you are considering investing money into a venture, and that it is more important than making the highest possible return. Please can you provide some detail on why you currently do not have social impact investments? Base: All those who do not have impact investments, but say it is important to consider social and environmental impacts when investing (n=210 responses)
Affluent millennials are equally likely to research, use technology, and use financial advisors to manage their assets

In line with how highly flexibility ranks in affluent millennials’ investment decisions, independence is very important in how they go about managing their investments; close to half (47%) report that they conduct their own independent research.

Parents and family advisors are not relied on as strongly as other investment management methods, with only 27% and 28% reporting that they use these respectively. This suggests that affluent millennials are keen to explore investments independently, and to shift away from the financial behaviours of their parents.

These results reveal some insight into millennial relationships with technology and financial advisors; whilst millennials are likely to use technology for their simplicity, level of control and objectiveness, it cannot yet replace the level of assurance provided by an advisor. This is illustrated in that similar proportions say that they seek advice from financial advisors (48%) and use technology (46%).

Q11. How do you go about managing your investable assets?
Base: All respondents (n=501)
Affluent millennials tend to prefer to use their money to travel, but saving for their future is clearly a priority

When asked about how they prefer to use their money, affluent millennials are more likely to say they prefer to spend it on travel (49%).

Supporting the trend that many of those surveyed have built their investable assets through saving, how they use their money also reflects this. 40% use their money to build up savings to act as an ‘emergency fund’.

Those with more investable assets have slightly different priorities in using their money. Buying or saving to buy property is more likely to be a priority for those with at least £75,000 in investable assets (49% £75,000+ vs. 36% £25,000-74,999), as is saving for their retirement (49% vs. 30% respectively).

They are also more likely to be focused on building up their savings to pass on to their family in the future (41% £75,000+ vs. 29% £25,000-74,999).

Q7. In general, how do you prefer to use your money?
Base: All respondents (n=501)
Nevertheless, a third (33%) say they plan to retire as soon as they have saved or invested enough to sustain their lifestyle without working.

These attitudes are fairly consistent across different demographic groups. However, those from the most affluent background are more likely to say they plan to retire as soon as they are able to (39% SEG A vs. 27% SEG B-E).

Q16. Which of the following best reflects your plans for working in the future?
Base: All respondents (n=501)

- I plan to keep working as long as I am able to
- I plan to retire when I have enough saved, but would like to keep working in some capacity
- I plan to retire as soon as I have saved or invested enough to sustain my lifestyle without working
- Don't know

“There has definitely been a shift in perception of working life, particularly from previous generations who tended to secure a job for the long-term. Now, people seem much more focused on flexibility and being able to balance work and home life. Many employers are prioritising retaining talent, whilst employees are more discerning about the work they do, and seem to move between jobs much more readily. These shifts in working practices may be a contributor to people choosing to work longer in some capacity”

Bethan Jones, Senior Associate in the Employment team
